

Production Supporting Systems in Factories

ระบบสนับสนุนการผลิตในโรงงานอุตสาหกรรม

Self-Hosting Node-RED

Advantages

- Greater performance
 - Fast to deploy
- Custom nodes
- Development environment
 - Test flows locally before deploying to production

Disadvantages

- Need to configure local tunnel setup to expose local Node-RED server to the internet. (ERPNext -> Node-RED connection)

Setting up Node-Red

Software

- Install [Node.js](#) (Version 24)
- Install [Visual Studio Code](#)

VSCode

- Change default terminal in `VSCode` (Windows only)
 - Open a window
 - Select `terminal` -> `New Terminal`
 - press `ctrl` + `p`
 - Type `> Terminal: Select Default Profile` and click
 - Select `cmd`

Package Manager

- `Node.js` comes with `npm` package manager.
 - But it is quite slow.
- Let's use a more performant package manager call `pnpm`.
 - `npm install -g pnpm`

Installing Node-Red

- Create a new folder
- Drag a folder into VSCode
- Select terminal -> New Terminal

Installing Node-Red

- `pnpm init`
- `pnpm install node-red @flowfuse/node-red-dashboard node-red-contrib-telegrambot node-red-contrib-influxdb`
- `pnpm approve-builds`

Modifying `package.json`

```
{  
  "scripts": {  
    "start": "node-red -u ./local -p 1880"  
  }  
}
```

Starting Node-Red

- `pnpm run start`
- Visit the web browser at
 - `http://127.0.0.1:1880` or
 - `http://localhost:1880`
